

SAZFI ERP

Client Domain Connection Guide | Pilot Edition 1.0 | October 2026

Developed by Sarim Creative Network

Purpose

Use this document when you already own a domain and want your SAZFI ERP workspace to appear under your own brand. Your current company website and email hosting normally do not need to be transferred.

1. Select your ERP address

Choose `erp.yourcompany.com` or `accounts.yourcompany.com`. Both are valid; select just one as your primary address. Avoid `accounts.com.company.com` unless the company explicitly owns and intends that exact nested subdomain.

2. Client onboarding steps

1. Submit the SAZFI company onboarding form with legal business name, contact details, client category and preferred hostname.
2. Confirm that your organization controls the domain and authorizes the requested subdomain.
3. SAZFI reviews the request and provides the exact DNS destination (A-record IP address or CNAME hostname) and any ownership-verification records.
4. A person authorized to manage the domain DNS adds only the records supplied for the chosen ERP subdomain.
5. SAZFI verifies DNS and HTTPS/SSL, completes company setup and then sends secure admin account activation instructions.
6. Test ERP login, company name/logo and required modules before the workspace is marked Live.

3. Example DNS instructions - illustrative only

Type	Host/Name	Value / destination
CNAME	erp	SAZFI-provided CNAME target
OR A	erp	SAZFI-provided server IPv4
Optional TXT	SAZFI-provided token name	SAZFI-provided verification token

Important: Never use the words above as literal DNS values. Use A or CNAME according to your SAZFI onboarding instructions. Do not create conflicting records for the same hostname. TXT records are used only when requested.

4. Where to change DNS

Open your DNS provider dashboard: for example Hostinger hPanel → Domains → DNS / Nameservers, or your active Cloudflare DNS zone. The place where you bought the domain may be different from the provider controlling its nameservers. Change records only at the authoritative DNS provider.

5. If the domain and hosting belong to different accounts

That is supported. Your existing website may remain with its current hosting account while `erp.yourcompany.com` points to SAZFI infrastructure. SAZFI does not need your email account password or full hosting credentials. You may share a screenshot of relevant DNS records with sensitive information hidden.

6. What happens next

DNS updates may take time to propagate. SAZFI will only activate the custom domain after the routing and TLS certificate are verified. Client users and the finance database must remain isolated from other companies.

7. If you do not want to change DNS

You may request a SAZFI-provided subdomain for pilot use. This does not require you to transfer your current domain.

8. Client checklist

- ☐ Chosen erp. or accounts. subdomain
- ☐ Approved domain-owner/DNS administrator contact
- ☐ SAZFI-issued DNS values received
- ☐ DNS changes applied only to ERP hostname
- ☐ Domain ownership and SSL confirmed
- ☐ Company administrator invited and tested

Security: Never email domain passwords, database passwords, CNIC scans or banking credentials with this form. SAZFI will provide a separate secure process if sensitive verification is later needed.
